How to program genie universal garage door opener

CC BY-SA 2.0/Dave Dugdale/flickr The process of programming a universal garage door remote varies according to the make and model of the device. With a wide variety of brands and models available, the differences between the programming methods can be considerable and distinctive to the brand. However, a universal in-car garage door opener remote is capable of linking with numerous garage door remote opening systems.One popular universal in-car remote brand is Homelink, and you can program it to work with a variety of garage door opening systems, including Liftmaster, Sears Craftsman, Chamberlain and Genie. The example below includes instructions for programming a Homelink in-car remote with a Genie garage door opening system. The process is similar with other brands. Safety First Make sure small children and pets are not near the garage doors when you program the garage door opener. The process requires you to operate the system, so it's important to keep them away from the area. Check Your Batteries Make sure the batteries in the remote have plenty of power. If you're unsure, replace them with new ones. Start Programming To start programming the Homelink in-car transmitter, turn the ignition key to the ACC position. Press the two outer buttons on the in-car remote at the same time. Wait for the LED light indicator in the car to start flashing rapidly. This clears out any previous programming in the in-car system. Choose a Button Choose any of the three buttons on the in-car remote to program your garage door opener. Next, hold the Genie garage door opener remote about two inches away from the Homelink in-car remote button you chose. Press and hold down the button on the Genie remote that opens your garage door and the button you selected on the in-car transmitter at the same time. The garage door should start opening at this point. Wait for the LED lights on both transmitters to flash rapidly. Once they do, it means you have successfully set the Homelink in-car transmitter button to open and close your garage door. Test To check the Homelink button for proper operation, open and close the garage door by pressing on the button. If the garage door responds, then you're all set. If the garage door doesn't respond to the Homelink button, repeat the process. You can also unplug the receiver in your garage for a minute and plug it back. Repeat the programming process. MORE FROM QUESTIONSANSWERED.NET COO/paulbr75/Pixabay For some people, the garage door is the front door of their property because they drive their vehicle into the garage and then enter the house through a side door. For others, it's just a door to a place filled with stuff that needs to be sorted through. However you see it, you need a secure door that doesn't jam and rarely needs maintaining. The look of the garage door is also important because it has to fit in with the rest of the property, and how well the door's insulated also has to be factored in if you want to work in the garage and you live in a cold-weather area. Garage Door/The price of the door and how much installation will cost are also important things to take into account, but don't go for the cheapest garage doors without considering your options. You could take a single layer steel door made from a 24-gauge steel skin, but you'll be compromising on security and warmth. A double-layered door is more durable, more energy-efficient and helps to keep road noise out. The added insulation also makes the garage warmer and more secure. A triple layered door with expanded polystyrene insulation is the most durable door, but it won't be the cheapest to buy. Automatic Garage Door OpenersAutomatic garage door openers are more convenient than manual doors, and they're also safer if you come home late at night. You basically have two options: a belt drive or chain drive opener. A belt driven opener is quieter and quicker but it's not as durable as the chain driven equivalent and it's more expensive. If you live in a cold climate, you will need the added durability of the chain. If not, you'll have to weigh the pros and cons for yourself. Garage Door SizesStandard overhead garage door widths are, generally, eight, nine or ten feet by seven feet for standard garage doors and twelve, fifteen, sixteen or twenty feet by seven for double garages. When you're thinking about constructing a double garage you have the option of installing a single door or a double door. Two single doors together often look better than one door and there are practical reasons to go this route. If you have a problem with one of the doors, you can still get your vehicles out of the garage through the other, and the price of two single doors is often very similar to one double. Double Garages for RVsIf you own an RV, you'll need a bigger garage not just a bigger garage door. The standard garage door height of seven feet won't be high enough. You'll need a garage opening that's sixteen feet wide by eight feet tall and the ceiling height of nine feet. If you're building a new garage to accommodate your RV, make sure you have proper architectural plans in place that allow space for the RV, other storage items and maybe even another vehicle. Garage Door PartsThere are loads of websites offering parts for garages so you can maintain the doors very cheaply. Whether you want new springs, rollers, locks or a remote, you'll only need a toolkit and some time to fix most of the issues that happen through wear and tear. The websites and retailers who sell you replacement parts also sell weatherproofing kits that can help you keep out the worst of the weather if you live in a cold weather area. Common Problems with Garage DoorsYou can repair a garage door yourself if you've got the right tools and you're confident enough to try, but if the door needs some major work, call an expert in. If the gear and sprocket assembly have begun to strip out because of wear and tear, you will find the opener making noise but not the door moving. This can be worrying but the work isn't expensive. Another common problem is the traveler or trolley becoming stripped out over time. The symptoms are the same as those with the gear and sprocket and the price for replacement is equally low. MORE FROM LIFE123.COM It's frustrating when your Genie garage door is out of whack. Your garage door needs to work in order for you to feel that you and your belongings are safe. Luckily, some issues can be fixed with easy troubleshooting. Follow these tips to fix common Genie door issues.The Safe-T-Beam Light Keeps BlinkingThe Safe-T-Beam Light is a safety feature required by the government that has to be installed in your Genie door in order for it to work properly. If the light is blinking, it means there's some sort of a malfunction. Check for things like loose wires, a dirty lens or any obstruction that may be blocking the lenses. Ensure that the lenses are mounted half a foot from the floor on either side of the garage door, and that they are perfectly aligned and facing each other.Your Genie Remote Control Isn't WorkingThe last thing you need is to pull up to your garage and find that the remote control doesn't work. In this type of situation, what's usually happened is that the remote was programmed incorrectly. Reprogram the remote to make sure that it's set up properly. If that's not the issue, check the batteries. You want to make sure that you're always operating with fresh batteries.Your Genie Door Reverses/Opens When You're Trying to Close ItWhen you try to close your garage door and it reverses and tries to open instead, it most likely means that there's an obstruction blocking the door. Look carefully to make sure that nothing is in the way. Check the lenses to make sure that they're properly aligned, mounted and facing each other. If it still doesn't work, you'll want to consult your manual.Your Door Opener Is Operating but Isn't Opening the DoorIf your Genie opener seems to be functioning but it isn't moving the door at all, it may be disconnected from the door. Check to see that it is connected. Make sure that the emergency release cord hasn't been pulled. If it has been pulled, you're going to have to reengage the carriage. Consult your owner's manual for your particular model to find out how to reengage the carriage.Certain Types of LED Bulbs Don't Work With Genie DoorsThe Genie manufacturer has been made aware that certain types of LED bulbs can cause problems with the radio signals emitted from their Genie garage doors. If people use regular LED bulbs on their Genie garage doors, those bulbs may affect the transmitter range, preventing the garage door from opening. To solve this issue, Genie has created its own brand of LED bulbs that you can use with their garage door openers. These bulbs eliminate the interference issue. MORE FROM QUESTIONSANSWERED.NET Programming Genie Intellicode Remote Transmitters Gently press and release the Receiver Learn Code button on the power head receiver of your door operator. This small, black, unmarked button is located behind the light lens at the motor head and is nearest the floppy 6 inch antenna wire that protrudes from the motor head. When pressed, a radio signal indicator light will start blinking red for 30 seconds. ** After pressing the Learn Code Button once, press your transmitter button three times for your system to grab the frequency and code it in. (Keep the transmitter you want tuned at least 2 feet away from the power head while tuning.) Press the transmitter button once more to test the system and start your door moving. **To erase all Intellicode remotes and wireless keyless entry, hold down on the learn button until the indicator light stops blinking, then proceed to Step 1. For Genie IntelliG, TriloG, SilentMax, PowerMax, GPower, and PowerLift Series Openers (Intellicode II) These include models 4024, 3024, 4042, 3042, 4022, 3022, and 4064, 3064, 4062, 3062, 2564, 2562. Looking up in your garage at the bottom of your Genie motor cover is a set of black buttons, depicted in the drawing below, along with two LED lights shown here in grey. Press and hold down the square button on the motor head until the round blue LED light come on, then release the square button. The long purple LED button will start to blink. (Note: if the blue light stays on, go to instructions for Intellicode III, below) While the long LED is blinking, hold the remote 4 or 5 feet away and press 3, 4 or 5 times, until the door activates. Your remote is now programmed. To clear all remotes and keypad from the system, follow Steps 1 and 2. After Step 2, while the purple LED is blinking, press and hold both triangular button until the purple LED goes out. This clears the radio receiver's memory. For Genie IntelliG, TriloG Series built from 2009 until July 8, 2011 (Intellicode III) (see serial # on front: first 2 digits = year, next 3 digits = day of the year) Press and hold down the square button on the motor head until the round blue LED comes on, then release the button. Press the square button once more until the long purple LED comes on and release. The purple LED should be blinking. To unlock the programming feature use a remote that already operates the unit and press it once. Purple light goes solid. Hold the new remote 4 or 5 feet away and press 3, 4 or 5 times until the door activates. The remote is then programmed Clearing Memory for Remotes and Keypad (if present) Follow steps 1 and 2 above or step 1 if between 2009 and July 8, 2011. While the long purple LED is blinking hold down on the UP and DOWN triangle buttons at the same time until both LEDs flash blue and go off. This clears the receiver memory. All previously programmed remotes will no longer work with your door. To re-program each remote follow steps 1 through 3 of the programming instructions relative to your opener above. Programming Digital Remote Transmitters with Internal Set Switches These transmitters work by matching the settings on the internal code setting switches with the same set of switches in the receiver on the garage ceiling. The receiver is located either behind the light lens of the Genie garage door opener motor head, or inside an external small rectangular box on the ceiling, which is connected to the motor head by a set of wires. Note: the frequency of the transmitter must be the same frequency as the receiver on the ceiling for it to work. Genie has been making the 390 MHz frequency exclusively for the last 15 years. Programming Multi-Button Digital Remotes with Internal Set Switches: These garage door opener transmitters have 2 smaller switches to the right of the internal Code Setting Switches. The small right switch should be set according to how many Code Setting Switches in your receiver (either 9 or 12). The small left switch is for programming purposes. To program a button for one of your doors, follow the instructions below: First, match the settings on the Internal Code Setting Switches with the same set of switches in the receiver on the garage ceiling, as described in the previous programming instructions. Next, move the small programming switch to 'S' (for SET) and connect to your wall button. CHAMBERLAIN / LIFMASTER / SEARS GARAGE DOOR OPENERS Programming 971LM and 973LM, 371LM and 373LM Security Plus Transmitters Press and release the square colored "smart" button on garage door opener motor unit. The smart indicator light will glow steadily for 30 seconds. The 971LM and 973LM remotes have a corresponding amber or red, square, learn button. The 371LM and 373LM have a corresponding purple, square, learn button. Learn buttons are located on the motor head near the terminal strip for wire connections. Within 30 seconds, press and hold the button on the hand-held remote, release the button when the motor unit light blinks. It has learned the code. If light bulbs are not installed, two clicks will be heard. PROGRAMMING THE 890MAX AND 893MAX Press and hold the program button on the remote control until the LED on the front of the remote control turns on. Press and release the remote control button you wish to use the number of times corresponding to the garage door opener type with a Learn button described below: To exit programming, press and release any remote control button except the button that was just programmed. Press and release the Learn button on the garage door opener or door control. Press the remote control button programmed in step 2 until the garage door opener lights flash or just hold 4 seconds. Test remote control. SLIDE OPEN BOTTOM FRONT OF REMOTE TRANSMITTER TO EXPOSE DIP SWITCHES AND PROGRAM BUTTON. MATCH THE DIP SWITCH SETTINGS WITH THE SETTINGS ON AN EXISTING REMOTE OR ON THE RECEIVER SETTING LOCATED ON THE CEILING. LOOK FOR THE FLOPPY ANTENNA WIRE TO FIND THE RECEIVER. PRESS THE PROGRAM BUTTON (SILVER BOX WITH SMALL BLACK BUTTON ON TOP) ON THE REMOTE TRANSMITTER UNTIL THE LED LIGHTS UP. SELECT ONE OF THE TWO REMOTE TRANSMITTER BUTTONS THAT YOU INTEND TO USE FOR OPENING THE DOOR. PRESS THIS BUTTON THE NUMBER OF TIMES SHOWN ON THE CHART, BASED ON THE BRAND AND NUMBER OF DIP SWITCHES LISTED IN DESCRIPTION. CODE IS ACCEPTED WHEN DOOR ACTIVATES. PRESS THE PROGRAM BUTTON ON THE REMOTE TRANSMITTER TO TURN OFF THE PROGRAMMING MODE. PROGRAM IS COMPLETE. PRESS SELECTED BUTTON TO TEST. # TIMES TO PRESS BTMNBANDDESCRIPTIONYEAR 375UT / 380UT 11CHAMBERLAIN9 POSITION90-92 12CHAMBERLAIN9 POSITION CANADA90-92 13 / 16GENIE12 POSITION90-95 14LINEAR MULTICODE10 POSITION76 15CHAMBERLAIN8 POSITION83-89 16STANLEY/MULTICODE10 POSITION76 17 / 20GENIE9 POSITION85 18LINEAR8 POSITION76 19CHAMBERLAIN7 POSITION83-89
